

Artificial intelligence (AI) is the development of computer systems capable of performing tasks that typically require human intellect, such as learning, reasoning, problem-solving, and decision-making.

Key Concepts

- **Machine Learning:** A core subset of AI where computers analyze data to identify patterns and learn from experience without being explicitly programmed for every specific scenario.
- **Deep Learning:** An advanced branch of machine learning that utilizes complex, brain-inspired neural networks to process massive datasets.
- **Generative AI:** Systems trained to produce original content—such as text, images, or audio—based on the prompts and patterns they have learned.

Common Classifications

AI is generally categorized by its capabilities and focus:

1. **Artificial Narrow Intelligence (ANI):** Also known as "weak AI," these systems are designed to excel at one specific task (e.g., voice assistants, translation software, or playing chess).
2. **Artificial General Intelligence (AGI):** Often referred to as "strong AI," this refers to hypothetical future systems that possess cognitive abilities equal to or surpassing human intelligence across any field.
